

Arabic POS Tagging

Emad Mohamed, Sandra Kübler

Indiana University

The Structure of Arabic Words

- ▶ An Arabic word may consist of several segments.
- ▶ Possible segments: inflectional affixes, the stem, clitics
- ▶ example: `WsyktbwnhA` (Engl.: *and they will write it*):
 - ▶ conjunction: `w`
 - ▶ future particle: `s`
 - ▶ 3rd person imperfect verb prefix: `y`
 - ▶ imperfect verb: `ktb`
 - ▶ 3rd person feminine singular object pronoun: `hA`

The Structure of Arabic Words

- ▶ An Arabic word may consist of several segments.
- ▶ Possible segments: inflectional affixes, the stem, clitics
- ▶ example: `WsyktbwnhA` (Engl.: *and they will write it*):
 - ▶ conjunction: `w`
 - ▶ future particle: `s`
 - ▶ 3rd person imperfect verb prefix: `y`
 - ▶ imperfect verb: `ktb`
 - ▶ 3rd person feminine singular object pronoun: `hA`
- ▶ POS tag:
[CONJ+FUTURE_PARTICLE+
IMPERFECT_VERB_PREFIX+IMPERFECT_VERB+
IMPERFECT_VERB_SUFFIX_MASC_PLURAL_3RD_PERSON+
OBJECT_PRONOUN_FEM_SINGULAR]

Tagging Approaches

- ▶ whole word tagging: assign complex tag to complete word

- ▶ segment-based tagging: segment first; then assign tags to segments

Conclusion

Data Set & Experimental Setup

- ▶ Penn Arabic Treebank (after-treebank POS files)
- ▶ P1V3 + P3V1: ca. 500 000 words
- ▶ non-vocalized version
- ▶ reattached conjunctions, prepositions, pronouns, etc. to get text as written
- ▶ remove null elements: $\{i\$otaraY+(null) / PV+PVSUFF_SUBJ:3MS \Rightarrow \{i\$otaraY / PV$
- ▶ 5-fold cross validation
- ▶ evaluation: per-segment accuracy (SAR) + per-word accuracy (WAR)

Memory-Based Segmentation

- ▶ per character classification: segment-end, no-segment-end
- ▶ memory-based learning: TiMBL
- ▶ features: focus character, previous 5 characters, and following 5 characters, POS tag for word based on whole word tagging
- ▶ TiMBL parameters: IB, overlap metric, gain ratio weighting, nearest neighbors $k = 1$
- ▶ two rounds: in second round include class from first round

Segmentation Results

all words:	98.23%
known words:	99.75%
unknown words:	82.22%

Segmentation Results

all words:	98.23%
known words:	99.75%
unknown words:	82.22%

proper noun errors: 33.87% of all errors

% unknown words in data: 8.5%

- ▶ memory-based tagger: MBT
- ▶ parameters: Modified Value Difference metric, $k = 25$
- ▶ for **known words**: IGTre, 2 words to left, their POS tags, focus word, its ambitag, 1 right context word, its ambitag
- ▶ for **unknown words**: IB1, focus word, first 5 + last 3 characters, 1 left context word + its POS tag, 1 right context word + its ambitag
- ▶ previous decisions are included

POS Tagging Results

gold standard seg.		segmentation-based		whole words
SAR	WAR	SAR	WAR	WAR
96.72%	94.91%	94.70%	93.47%	94.74%

POS Tagging Results

gold standard seg.		segmentation-based		whole words
SAR	WAR	SAR	WAR	WAR
96.72%	94.91%	94.70%	93.47%	94.74%

POS Tagging Results

gold standard seg.		segmentation-based		whole words
SAR	WAR	SAR	WAR	WAR
96.72%	94.91%	94.70%	93.47%	94.74%

- ▶ gold standard segmentation: upper bound
- ▶ gives best results

- ▶ no gold standard segmentation available: whole words better than automatic segmentation

- ▶ segmentation → more ambiguity per segment
- ▶ small percentage of unknown words

- ▶ in segmentation-based tagging, 28% of all errors are results of wrong segmentation

Known vs. Unknown Words

	gold std. seg.	seg.-based	whole words
known words	95.90%	95.57%	96.61%
unknown words	84.25%	71.06%	74.64%

Error Analysis

confusion sets:

gold	tagger	% of errors
noun	adjective	7.88%
adjective	noun	7.75%
proper noun	noun	9.10%
noun	proper noun	2.51%

- ▶ no clear distinction between nouns and adjectives in Arabic: adjectives behave morphologically like nouns and can be used as nouns
- ▶ proper nouns are normally standard nouns, and are not marked specifically

Arabic + POS

Error Analysis

Conclusion

Comparison to Habash & Rambow

- ▶ whole word tagging
- ▶ then convert to Habash & Rambow tokenization + reduced tagset: 15 tags

	H&R ATB1	H&R ATB2	whole word tagger
Token. acc.	99.1	—	99.33
POS acc.	98.1	96.5	96.41

Conclusion & Future Work

- ▶ whole word tagging has higher accuracy than segmentation based tagging
- ▶ no preprocessing necessary
- ▶ but Penn Arabic Treebank has low percentage of unknown words

- ▶ segmentation quality is bottleneck for improving segmentation-based tagger
- ▶ need to find more reliable segmentation
- ▶ will integrate vocalization with segmentation
